- **Automatically limits the number of customers inside the premises.**
- **No need for staff to monitor the number of customers going In and Out.**
- **Can be linked to your existing entrance automatic door system and locking.**
- **Optional monitors or traffic lights show outside queuing customers if the maximum number inside has been reached.**

FlowControl is an automatic density control system for use in any building where the number of customers needs to be limited for health and safety reasons.

When each customer enters or leaves the premises they are automatically counted In or Out, so that the maximum number inside can be controlled. This information is clearly displayed on a staff monitor screen.

FlowControl can be linked to the existing automatic entrance door operator to stop the door from opening to additional customers when the maximum number inside has been reached. Optional LED 'Traffic Lights' or a second monitor screen clearly show customers waiting outside that the maximum capacity has been reached and that the door needs to temporarily remain shut.

As customers leave the premises, taking it below maximum capacity, a green traffic light is displayed and the door operates in standard mode again.
